Next, the elevator could be called to a specific floor when the call floor subroutine, operates. When the First, Second, or Third floor call button is pressed, its output coil turns on, sealing the button. The output also deactivates the other two floors rungs. With a floor called, the program returns to the

### Elevator Ladder

Abstract- This is an implementation of a control system of a four-floor elevator using Ladder Logic Control. Programmable Logic Controller is being used for the control and processing application. As we see high rise buildings and skyscrapers being developed in every city a stable working elevator is the most important feature of the same.
