Impulsivity The Behavioral And Neurological

Impulsivity explores the basis for the seemingly universal tendency to devalue rewards or punishments that are not immediately available. When confronted with any number of modern impulsive behaviors—such as drug use, pathological gambling, marital infidelity, and gluttony—individuals have a choice with two outcomes: an immediate benefit, such as getting high, or a delayed or probabilistic benefit, such as health, money saved, or the satisfaction of a good life.

Impulsivity is often accompanied by symptoms such as restlessness, hyperactivity, inattention, problems doing quiet activities, problems with executive function, talking excessively, and fidgeting. Impulsivity can, less commonly, be related to medical problems that interfere with an individual's cognitive function, such as stroke or dementia.

Impulsivity: Symptoms, Signs, Causes & Treatment

Natalie L. Cuzen, Dan J. Stein, in Behavioral Addictions, 2014. Behavioral Addiction: on the Border between Impulsivity and Compulsivity. Behavioral addictions arguably lie on the border between compulsivity and impulsivity. These conditions may be characterized by both compulsive and impulsive features, and so are sometimes called impulsive-compulsive disorders.

Impulsive subjects, therefore, overestimate the duration of time intervals and, as a consequence, discount the value of delayed rewards more strongly than do self-controlled individuals. The literature on time perception and impulsivity, however, is not clear cut and needs a better theoretical foundation.

Decision making, impulsivity and time perception

PKC γ may be an important mechanism within the cell that mediates one or more neurochemical pathways relevant to an increased predisposition to alcoholism and behavioral impulsivity (Bowers & Wehner, 2001). Studies delineating additional mechanisms underlying these genetically-based relationships between impulsivity and propensity to develop AUDs will be an important future research direction.
