Transfontanellar Doppler Imaging In Neonates

This book examines in detail the role of transfontanellar pulsed and color Doppler imaging in the fetus and neonate. After an introductory chapter its use in the normal neonate is considered. Results of the hemodynamic evaluation of 491 newborns aged from 32 weeks of gestation to 9 months by means of pulsed and color Doppler are reported.

Ultrasound imaging. Transfontanellar ultrasonography is investigated with a multifrequent sector probe S 4-10 (7MHz), 3D/4D curved array probe RNA 5-9-D (8MHz) and transtemporal Doppler ultrasound uses a M5S sector probe (3 MHz). Transfontanellar examination includes B-mode scan, 2D and 3D Power- or Color-Doppler ultrasound of both hemispheres.
